NORMALLY-CLOSED SOLENOID VALVES

For refrigeration plants that use transcritical R744 refrigerant
Application

The solenoid valves illustrated in this leaflet have been developed by Castel for all the applications that use the trans-critical R744 refrigeration fluid belonging to Group 2, defined in Article 13, Chapter 1, Point (b) of Directive 2014/68/EU, with reference to EC Regulation No. 1272/2008.

CAUTION!: these solenoid valves cannot be used with other refrigerant fluids.

Operation

The valves listed in this leaflet are normally closed valves (NC). This means that when the coil is not energised, the plunger closes the fluid flow. When the coil is energised, the plunger opens the valve seat connecting the inlet to the outlet.

The valves in series 1437E and 1438E are pilot-operated piston solenoid valves. Their operation depends not only on the magnetic field produced by the current flow into the coil, but also on a minimum inlet pressure, which is necessary to:

- open the piston and keep it lifted off the main opening
- close the piston and ensure the tightness on the main opening
- open the piston and keep it lifted off the main inlet pressure, which is necessary to:
  - control the refrigerating system when the valve is clean.
  - make sure that the refrigerating system is clean.

Before connecting the valve to the pipe, it is advisable to make sure that the refrigerating system is clean. In fact, valves with PEEK gaskets are sensitive to dirt and debris. Furthermore, check that the flow direction in the pipe corresponds to the arrow stamped on the valve body. All the valves can be mounted in any position so long as the coil does not point downwards.

Installation

The valves series 1437E and 1438E can be installed on the three main branches of a system (hot gas line, gas cooler line, and suction line), while respecting the limits of use and the capacities.

Table shows the following functional characteristics of a solenoid valve:

- Connections
- PS: maximum allowable pressure
- TS: maximum / minimum allowable temperature
- Kv: discharge factor
- minOPD: minimum Opening Pressure Differential.
- MOPD: maximum Opening Pressure Differential according to AHRI STANDARD 760 : 2014. This is the maximum pressure differential between inlet and outlet at which a solenoid valve can open and stay opened or close and maintain the seal.
- minimum pressure differential between inlet and outlet at which a pilot-operated solenoid valve can open and stay opened or close and maintain the seal.
- max OPD: maximum Opening Pressure Differential.

Before connecting a valve to the electrical system, be sure that the line voltage and frequency correspond to the values marked on the coil.

Catalogue Number | Connections ODS | Gas cooler line | Hot gas line | Suction line | Refrigerant flow capacity
--- | --- | --- | --- | --- | ---
1437E/4S050 | 3/8" | 18,0 | 15,0 | 18,0 | Gas-cooler outlet temperature 95 °F (35 °C)
1437E/4S070 | 1/2" | 20,9 | 20,9 | 20,9 | Evaporating temperature 14 °F (-10 °C)
1437E/4S070 | 1/2" | 20,9 | 20,9 | 20,9 | Evaporator outlet temperature 23 °F (-5 °C)
1438E/M10S050 | - 10 | 21,0 | 15,0 | 21,0 | Evaporator superheating 6 °R (5 °K)
1438E/M125050 | - 10 | 21,0 | 15,0 | 21,0 | Suction line temperature 32 °F (9 °C)
1438E/M125070 | - 10 | 21,0 | 15,0 | 21,0 | Suction line superheating 4 °R (5 °K)
1438E/M125050 | - 10 | 21,0 | 15,0 | 21,0 | Discharge temperature 212 °F (110 °C)
Castel has always been aware of environmental sustainability issues and gives its contribution to a cleaner environment, supplying the refrigeration and air conditioning industry with state-of-the-art and environment-friendly technology. With its commitment and steady research in its laboratories, Castel has developed a whole range of products using natural refrigerants, which reduce emissions to the minimum. The large range of products belonging to the Castel “GoGreen” line has been developed to be used in CO2 (R744) - and HC hydrocarbon-filled systems.
